In the *Physics*, Aristotle asks whether nature acts for the sake of something. He offers an account of rain as water that rises when heated by the Sun, then cools, condenses, and falls to Earth, but is not particularly concerned with explaining rain as such. Rather, he addresses a more general question: how to account for natural objects, events, and processes that appear with regularity. He queries whether the sharpness of front teeth and the bluntness of molars is coincidental and rejects that possibility, because this arrangement occurs with regularity and that regularity is linked to purposefulness. The sharpness of front teeth allows them to tear while the bluntness of those in the back enables them to crush food; both are useful for eating. In Aristotle's view, all natural things happen in a given way and occur for the sake of something; that is the final cause.

* query: 의문을 제기하다 ** bluntness: 뭉툭함 *** molar: 어금니

- ① Aristotle treated the regular arrangement of teeth as a sign of purpose rather than chance.
- ② Aristotle concluded that the sharpness and bluntness of teeth are ultimately a matter of mere coincidence.
- ③ Aristotle's primary purpose in the *Physics* was to provide a thorough explanation of how rain is formed.
- ④ The blunt molars at the front of the mouth function to tear food apart before swallowing.
- ⑤ Aristotle held that natural processes unfold by accident and serve no particular end.

다음 글의 내용과 일치하지 않는 것은?

AI is a prolific idea generator. Human brainstorming groups tend to focus on the quality of creative ideas and almost immediately lean into variations of first suggestions, but good ideas are more likely when groups focus first on quantity. As Linus Pauling put it, "The best way to have a good idea is to have lots of ideas." Psychologist Dean Keith Simonton called this the "equal odds rule" arguing that creative success is correlated to the total number of works created. Many studies have confirmed that creative quality comes from quantity of ideas (what Bob Sutton at a design and innovation consulting company called "idea ratio"), and one Stanford study pegged the number of ideas that distinguish a successful product from a failure at more than two thousand. This is why design thinking and innovation are so focused on the processes (what Utley and Klebahn call "idea flow") of creating possibilities without judgment.

* prolific: 많이 만들어 내는, 다작의 ** peg: 못박다

- ① AI is described as capable of generating ideas in great abundance.
- ② Left to themselves, human groups are inclined to settle quickly into variations of their first ideas.
- ③ The "equal odds rule" holds that a creator's success depends on the quality, not the quantity, of the works produced.
- ④ A Stanford study put the gap between a successful and a failed product at over two thousand ideas.
- ⑤ Design thinking values producing many possibilities before applying any judgment to them.

다음 글의 내용과 일치하는 것은?

Sharing meanings and experiences is not a simple, automatic process: whenever two or more people observe or participate in the same ongoing event they experience it from different perspectives, with different histories, with different background knowledge. These differences are most glaring when the individuals involved include an infant or very young child and an adult, although an adult arranging an event for an infant may find it difficult to keep these differences in mind. When giving a bath, for example, a parent whose experience with water play has been fun, whose knowledge about the source of the water and its disposition provides confidence, and whose body control ensures that the baby is safely held and not in danger, expects the infant to enjoy splashing water. Yet the baby may make it clear (perhaps by terrified crying) that her perspective is quite different from that of the adult. The two share an experience, but not a meaning.

* glaring: 두드러진 ** disposition: 성질

- ① Sharing experiences with another person is generally an effortless and instinctive process.
- ② Even when an adult and a baby go through the very same event, the significance each attaches to it can diverge.
- ③ A parent's knowledge of the water's temperament is what makes the baby feel reassured.
- ④ The baby ends up crying because the bathwater is in fact genuinely dangerous to her.
- ⑤ The gap in perspective between two adults is wider than that between an adult and an infant.

A detailed anthropological study of daily scientific practice in the Salk Institute laboratory in La Jolla, California shows how difficult it is to assign credit and dates. Bruno Latour describes how scientists arrived at the elucidation of TRF (thyrotropin-releasing factor), a hormone that is secreted by the brain. He says that his observations led him to “the conviction that a body of practices widely regarded by outsiders as well organized, logical, and coherent, in fact consists of a disordered array of observations with which scientists struggle to produce order.” The final consensus formulation of TRF (i.e., when it became a scientific “fact”) emerged some time between January 1968 and January 1970. Half of the Nobel Prize in Medicine for 1977 for this discovery was shared between the Salk group and another competing group in New Orleans (the other half went to Rosalind Yalow for the techniques she developed that were used in these studies), but each of these two competing groups strongly felt that they deserved sole credit and that the other did not deserve even a share of the award.

* elucidation: 규명, 설명 ** secrete: 분비하다 *** array: 배열

- ① Latour concluded that scientific practice, though seen as orderly by outsiders, is in reality a disordered set of observations.
- ② Rosalind Yalow received her share of the prize for techniques she had developed and that were used in the research.
- ③ The point at which TRF became an accepted scientific fact cannot be fixed to one precise date.
- ④ TRF is a hormone that is released by the thyroid gland.
- ⑤ Despite jointly receiving the award, each rival group believed it alone deserved the credit.

The use of emotion may be important in exercise, particularly among exercise instructors. It has been established that exercise enjoyment is associated with increased exercise adherence. An instructor might aim to foster enjoyment in his participants as a means of increasing their program adherence. An instructor also might use emotion to elicit greater effort from her students. Cuing participants to feelings of anger and frustration during a cardio kickboxing class might lead to more effortful punches and stronger kicks. Conversely, a yoga instructor could use positive emotions or emotion-related states such as compassion to get her students in the proper mindset for their practice. Evidently, there are a number of ways emotions could be used to enhance performance in sport and exercise.

* adherence: 지속성, 고수 ** elicit: 이끌어 내다 *** cardio kickboxing: 유산소 킥복싱

- ① A sense of enjoyment during exercise has been found to reduce participants' adherence to a program.
- ② Cuing feelings of anger and frustration is appropriate mainly for yoga classes.
- ③ A yoga instructor draws on negative emotions such as compassion to settle her students.
- ④ The link between exercise enjoyment and adherence has not yet been proven.
- ⑤ Emotions can be used in more than one way to enhance performance in sport and exercise.

The most fundamental rule regarding the use of any measuring device is that the device should always be read to its optimum capability with regard to precision. Precision is reflected in the number of digits in a measurement; the more digits this measurement has, the more precise it is. For example, the measurement 345.2 inches is more precise than the measurement 345 inches. If it is possible to obtain the first digit to the right of the decimal point from a device, then that digit should be recorded; if it is possible to obtain the second digit to the right of a decimal point, then that digit should be recorded, and so on. Thus, a laboratory worker should endeavor to obtain the most digits possible from whatever device is being used whether it is a ruler, thermometer, barometer, or any other measuring device.

- ① The measurement 345 inches is more precise than 345.2 inches.
- ② The more digits a measurement has, the more precise that measurement is.
- ③ The most fundamental rule is to read a measuring device to its optimum capability with regard to precision.
- ④ Any digit that can be obtained to the right of the decimal point should be recorded.
- ⑤ A laboratory worker should endeavor to obtain as many digits as possible from whatever device is used.

In academia, you are taught to write up your results thus: "I came up with a hypothesis, then I did this experiment, and then I did another experiment, then I tested my ideas some more, and so on until [dramatic fanfare] ta-da! I proved this." If you wrote this way online, very few of your readers would make it to your dramatic conclusion, no matter how exciting or groundbreaking it was. Online, we don't have the patience to wait for your big reveal at the end. Instead, you need to tell us up front: "I proved this! And here's how I know it..." Your readership may still dwindle and trail off over the course of your writing, but at least the vast majority know what it is you've achieved from the very beginning. A few more of them may stay along for the ride if the opening line — the "hook," in journalistic terms — is particularly interesting. If you grab their attention early, you can more likely convince more readers to stay for the whole story.

* dwindle: (점점) 줄어들다

- ① Academic writing is taught to present its conclusion before describing the experiments.
- ② Even when the main point is stated up front, some readers may still drift away before the end.
- ③ A striking opening line guarantees that the entire readership will finish the whole story.
- ④ Online readers are willing to wait patiently for a dramatic conclusion if the topic is groundbreaking.
- ⑤ The author recommends writing online in the same step-by-step way as in academia.

The human perceptual system is designed to recognize objects under changing illuminations, situations, and contexts. It is extraordinarily adapted to a constantly changing world. To deal with this uncertainty, the brain uses not one, but multiple routes. If one is blocked, it takes another route. This immense flexibility of the brain to rely on changing cues, according to whatever is available, is known as vicarious functioning. It can be found in most biological systems. In extreme cases, only a few lines are sufficient, as when we recognize the face of a celebrity in caricatures made with just a few pencil strokes. Face recognition also functions even when parts of a face are covered and internal features such as eyes are hardly visible. In this case, the brain relies on external features such as hair and head shape. For instance, migrating birds fly thousands of miles and may rely on the stars to navigate. But if it's a cloudy day, they may instead rely on landmarks or their magnetic sense. Similarly, the brain can recognize a face by the shape of the eyes, nose, and mouth.

* illumination: (불)빛, 조명 ** vicarious: 대리

- ① The human perceptual system can identify objects despite changes in lighting and context.
- ② When one route is blocked, the brain switches to an alternative route.
- ③ Migrating birds may use landmarks or a magnetic sense when the stars are not visible.
- ④ Vicarious functioning is found exclusively in the human brain, not in other organisms.
- ⑤ A few pencil strokes can be enough for us to recognize a celebrity's face in a caricature.

다음 글의 내용과 일치하는 것은?

Deep work is when you perform an activity with deep concentration that pushes your cognitive capabilities, and by doing so create new value and improve your skills. These efforts are hard to replicate; and to be able to do deep work, we need a distraction-free environment. For many people though, we spend far too much time on the other end of the scale, doing what is referred to as shallow work. This style of working is not cognitively demanding but is rather an execution of logical-type tasks that rarely create new value (although they may still be important). We often perform these tasks while we are distracted. Shallow work has its place, both because routine-type tasks need to be done and because we cannot spend our entire time doing deep work. The problem with too much shallow work is that we feel busy, maybe even stressed, but we rarely see any output reflecting our experienced effort.

* replicate: 재현하다, 반복하다 ** execution: 실행, 수행

- ① Shallow work demands a high level of cognitive effort because of its logical nature.
- ② The new value produced through deep work can be readily copied by other people.
- ③ Doing shallow work is partly justified because one cannot spend all of one's time on deep work.
- ④ People tend to carry out deep-work tasks even while they are distracted.
- ⑤ Shallow work produces no value whatsoever, so it ought to be eliminated.

다음 글의 내용과 일치하지 않는 것은?

Symbols are instrumental in helping people derive meanings from social situations. In social encounters, each person's interpretation or definition of a given situation becomes a subjective reality from that person's viewpoint. We often assume that what we consider to be "reality" is shared by others; however, this assumption is often incorrect. Subjective reality is acquired and shared through agreed-upon symbols, especially language. If a person shouts "Fire!" in a crowded movie theater, for example, that language produces the same response (attempting to escape) in all of those who hear and understand it. When people in a group do not share the same meaning for a given symbol, however, confusion results; for example, people who did not know the meaning of the word fire would not know what the commotion was about. How people interpret the messages they receive and the situations they encounter depends largely on their own perception.

* instrumental: 도구적인, 중요한 역할을 하는 ** commotion: 소동, 소란

- ① The belief that everyone shares our own version of reality frequently turns out to be mistaken.
- ② Subjective reality is gained and shared by means of mutually accepted symbols, language in particular.
- ③ The way people make sense of the situations they face rests largely on their individual perception.
- ④ When members of a group attach different meanings to the same symbol, confusion arises.
- ⑤ A shout of "Fire!" prompts the same escape response in everyone who hears it, even those who do not grasp the word's meaning.

There are estimated to be more than 160,000 farms spread across Northern Ireland and the Republic of Ireland combined. On all of those farms, you will find barns, and in some of those barns, you might be fortunate enough to stumble across a classic tractor like the Massey Ferguson 35. Production of the Massey Ferguson 35 in the UK and the USA stopped in 1964. If you were to strike up a conversation with a farmer who still owns one, she might well give the chassis of her Massey Ferguson 35 an affectionate tap and nostalgically remark, 'They don't make 'em like that anymore.' The fact that the tractor has survived at least fifty-eight years seems to provide evidence of its superior build quality. But wait — how long did the other 388,381 Massey Ferguson 35 tractors produced between 1956 and 1964 last before they went for scrap? Rather than build quality, it might well be the fondness that people in Ireland have for the little red tractor (Harry Ferguson, who developed it, was born in Ireland) that has led farmers there to hold on to their Massey Fergusons and take care of them as well as they have.

* stumble across: ~을 우연히 발견하다 ** chassis: 차대(자동차의 기본 프레임 구조) *** scrap: 폐품

- ① Irish people's fondness for the little red tractor, rather than its build quality, likely explains why farmers there have kept and cared for it.
- ② All of the 388,381 tractors built between 1956 and 1964 have survived to the present day.
- ③ The author concludes that the tractor's long survival proves its superior build quality.
- ④ Production of the Massey Ferguson 35 in the UK and the USA continued until 1956.
- ⑤ Harry Ferguson, who developed the tractor, was born in the USA.

다음 글의 내용과 일치하지 않는 것은?

During crises that present immediate danger (e.g., natural disasters, acts of violence or terrorism, transportation crises), people seek trusted and verified sources to ease their immediate concerns, thus turning to traditional sources such as television and radio. For other crisis types, such as public health and political crises, however, people are more likely to turn to social media where they can seek multiple voices and a variety of expert opinions, as, unlike the first set of crises, public health and political crises may be more subjective and less straightforward, and thus necessitate a deeper dive into supplementary information and evidence. In addition to the type of crisis at hand, Liu, a communication scholar, and colleagues argued that traditional and social media have different effects on different audiences regarding the motivation to follow instructions and recommended behaviors during crises. For example, although younger audiences seem to favor social media to traditional media sources during times of crisis, older audiences indicate a preference for traditional media. Thus, both traditional and social media play a prominent role in delivering important scientific information to the public during crises.

- ① During crises posing immediate danger, people tend to rely on traditional sources such as television and radio.
- ② Public health and political crises tend to be more subjective and less clear-cut than immediate-danger crises.
- ③ Older audiences, much like younger ones, prefer social media during times of crisis.
- ④ Liu and colleagues argued that traditional and social media affect different audiences differently.
- ⑤ The author concludes that both traditional and social media play an important role in delivering scientific information during crises.

Women's dresses from the eighteenth century offered a great opportunity for repurposing, as they were frequently fashioned from long, uncut lengths of fabric. Textiles were significantly more costly than the labor it took to alter them, and as a result, most garments were modified numerous times to keep up with changes in fashion. "Even the wealthy saved fabrics, remodeled clothes, and sold unwanted items in the secondhand market," observes fashion scholar Linda Welters. "Sustainability was a way of life." Indeed, although change is inherent to fashion, the remodeling of the existing clothing, rather than buying new, was a widespread practice. It is rare, in fact, to find an eighteenth-century dress that does not show some sign of alteration. The cost of having a gown made, or remade, was only about half the cost of the textile itself and could be significantly less, depending on the type of fabric. In addition to updated dress silhouettes, accessories and trimmings played an important role in refreshing old clothing styles. For example, the addition of a row of lace on an upper part of a gown was an economical alternative to the full replacement of the gown. Many eighteenth-century dresses, particularly those from the first half of the century, were constructed with relatively crude stitches, indicating that the effortless alteration of the original gown was a consideration. Because fabrics retained value even when they were not in fashion, hand-woven silks, cherished for their quality and beauty, were sometimes passed down through generations.

* garment: 의복 ** crude: 조잡한 *** cherish: 소중히 여기다

The rise of internet-based technologies means that news is produced, distributed, and consumed faster than ever before. However, the reliability of this news is questionable. Not all organizations or individuals putting out information spend time checking the details or putting the facts into a wider context.

People are confronted with overwhelming amounts of information not just on a daily basis, but via minute-by-minute updates transmitted to audiences around the globe. More than ever before, people are involved in organizing and managing the amount and type of news they receive. The internet means that irrespective of where we are in the world or what time of the day it is, news can be accessed from broadcasters located anywhere on the planet. As "new media" such as mobile phones, computers, and other portable devices have become more affordable, compact, and embedded in everyday life, they have come to replace television and newspapers. For younger people, advances in technology form part of the world they were born into. But the ease of use and affordability of new media means that they are an integral feature of the lives of people of all ages.

For US sociologist Matthew Hindman, technological advances have made news more "democratic," meaning that now people of all ages and from all social backgrounds can access it. Others fear that new media poses a threat. Information on the internet is often unregulated, so while it is more accessible than ever before, its reliability is difficult to discern.

* embed: 깊숙이 자리 잡게 하다 ** discern: 분별하다

일치

다음 글의 내용과 일치하는 것은?

The manager of the Humane Society was out of town for two weeks, and Elaine was placed in charge. Since she had taken on this responsibility before, she was familiar with the challenges she might encounter — impounding stray animals, reuniting pets with their owners, informing people their pet hadn't been found, accepting animals from those who could no longer care for them, or turning animals away when the shelter was full. Though she found the work demanding, she handled these situations with confidence and calm.

On the first day of the manager's absence, everything was running smoothly until a woman arrived with a cat and asked to leave it at the shelter. Elaine's first question was whether the cat was a stray or not, since the shelter was obligated to take in strays but could refuse owned pets. The woman said it was her cat and explained that she was moving and couldn't take it with her — a common excuse. Although the shelter sometimes accepted pets in such cases, it was already housing over ninety cats, nearly double its capacity of fifty, so Elaine had to politely refuse.

Elaine calmly explained that there was no space available, but the woman became visibly upset and said, "If you don't take this cat, I'll just have to let it go somewhere." Although such statements were sadly not unusual, they always troubled Elaine. Still, she maintained professionalism, offered contact information for other shelters, and tried to help. The woman complained the alternatives were too far and repeated she had no other choice. Elaine then suggested the shelter might find a volunteer to transport the cat. In response, the woman, showing her frustration toward her, placed the cat's kennel in front of her, raised her voice, and left the shelter.

Elaine could no longer hold it in. She gently put the cat in a kennel and brought it to the back isolation area. Then she went to the back room and called the absent manager, who encouraged her to let it all out. Elaine shared what happened and released her emotions while the manager listened. She felt much better afterward and was relieved to have someone she could talk to without fear of judgment. Since then, the manager has encouraged staff to come to her if they need to release emotions kept in at work — and she listens.

* impound: 수용하다, 가둬 두다 ** stray: 길 잃은 *** kennel: 이동장 **** obligate: 의무를 지우다

다음 글의 내용과 일치하는 것은? (지문은 앞 페이지 참조)

- ① When the woman first arrived, Elaine immediately agreed to take in her cat.
- ② Elaine turned the cat away because she doubted the woman was really moving.
- ③ Over the phone, the manager told Elaine to firmly reject all such requests in the future.
- ④ Elaine kept her distress to herself and spoke to no one about it.
- ⑤ The shelter was holding roughly twice the number of cats it was designed for.

다음 글의 내용과 일치하지 않는 것은?

One evening, little William was on his way home from his friend's. He was passing through the market. On his way, he came across the beautiful aroma of some meatballs sold by an elderly vendor just across the road. The smell was so pleasant that little William had to stop by the stand to purchase some meatballs. However, the meatballs didn't have a listed price, so he decided to head directly home. Just as little William turned to leave, a firm voice stopped him.

It was the elderly vendor. "Wait! You can't just leave. Before you go, you have to pay," he said. Little William was surprised at the statement made by the elderly vendor. He asked him, "Payment for what, Sir? I didn't purchase any meatballs." The vendor insisted that although little William did not purchase any meatballs, he enjoyed the pleasant smell of his meatballs for quite a long time. He truly believed that little William had to pay for it because smelling was as good as eating.

Little William was upset about this. He didn't know how merely smelling the meatballs meant that he had to pay for them. After observing the man for a short while, little William dipped his hands in his pocket and jingled a few coins. The elderly vendor was excited to hear the coin sound. He said, "Now hurry up, boy. Pay the money fast." Little William replied, "I have already paid the money, Sir. You didn't understand?"

The shopkeeper angrily shouted, "When did you pay the money? You reached into your pocket but came out empty-handed!" Little William made it clear that he had just paid, reminding the shopkeeper that he had heard the jingle of the coins from his pocket. He added that if smelling is as good as eating, then hearing the sound of the coins should also be as good as receiving them. He smiled proudly and walked home from there, leaving the man completely surprised.

* jingle: (딸랑거리는) 소리; 딸랑거리다

- ① William stopped at the stand because the smell of the meatballs was so pleasant.
- ② William started for home without buying anything because the meatballs had no listed price.
- ③ William took a few coins out of his pocket and handed them to the vendor as payment.
- ④ The vendor demanded payment on the grounds that William had enjoyed the smell for a long time.
- ⑤ William claimed that hearing the coins jingle was as good as the vendor receiving them.
